GENERAL INFORMATION:
FAPLICANT: ACHEN, Marc G.
APPLICANT: STACKER, Steven A.
APPLICANT: STACKER, Steven A.
TITLE OF INVENTION: WESTHOODS FOR TREATING NEOPLASTIC DISEASE CHARACTERIZED BY
TITLE OF INVENTION: VASCULAR ENDOTHELIAL GROWTH FACTOR D EXPRESSION, FOR SCREENING
TITLE OF INVENTION: POR NEOPLASTIC DISEASE OR METASTATIC RISK AND FOR MAINTAINING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

APPLICANT: Wise, Lyn M
APPLICANT: Warcer, Andrew A
APPLICANT: Savory, Loreen J
APPLICANT: Savory, Loreen J
APPLICANT: Steacher, Stephen B
APPLICANT: Fleming, Stephen B
APPLICANT: Steacher, Stephen B
TITLE OF INVENTION: VASCULAR ENOTHELIAL GROWTH FACTOR-LIKE PROTEIN FROM ORF
TITLE OF INVENTION: VIRUS NZ2 BINNS AND ACTIVATES MAMMALIAN VEGF
FILE REFERENCE: Sequence Listing for 09/431,833
Patent NO. 6541008
Sequence 15, Application US/09125642C
Patent No. 6365393
GENERAL INFORMATION:
APPLICANT: BAYER AG
ITTLE OF INVENTION: Parapoxviruses Which Contain Foreign DNA, and
Their Production and Their Use in Vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

probable membrane protein YDR539w - yeast (Saccharomyces cerevisiae)

N.Alternate names: hypothetical protein D3703.2

Cybrecies: Saccharomyces cerevisiae
Cybrecies: 3accharomyces cerevisiae
Cybrecies: 10-Apr-1996 #sequence_revision 19-Apr-1996 #text_change 19-Apr-2002
Cybrecies: 562018

"Embryonic expression pattern of the murine figf gene, a growth factor belonging to platelet-derived growth factor/vascular endothelial growth factor family.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vertebral column.

INDUCTION: By the transcription factor c-fos.

FINIURATION: By the transcription factor c-fos.

FINIURATION: By the transcription factor c-fos.

FINIURATION: By the transcription for marrial of the formation with increased activity toward VEGFR-3 and VEGFR-2. VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed linked by disulfide bonds before secretion. The fully processed VEGF-D is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions (By similarity).

SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PROSITE; PS02249; PDGF 1; 1.

"Cloning and sequencing of porcine TIMPs.";
"Cloning and sequencing of porcine TIMPs.";
submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Complexes with metalloproteinases (such as collagenases)
and irreversibly inactivates them.
-!- SHDEELLULAR LOCATION: Secreted.
-!- PTM: The activity of TIMP1 is dependent on the presence of disulfide bonds.
                                                                                                                                                                                                                                                                                 Gaps

"AIM1, a novel non-lens member of the betagamma-crystallin
superfamily, is associated with the control of tumorigenicity in human
malignant melanoma.";
Proc. Natl. Acad. Sci. U.S.A. 94:3229-3234(1997)
-! FUNCTION: May function as suppressor of malignant melanoma. It may
exert its effects through interactions with the cytoskeleton.
-! SIMILARITY: Belongs to the beta/gamma-crystallin family.
-! SIMILARITY: Contains 12 beta/gamma crystallin 'Greek key' domains.
-! SIMILARITY: Contains 1 ricin B-type lectin domain.

Proc. Natl. Acad. Sci. U.S.A. 94:11472-11477(1997).
-!- FUNCTION: Possible transcription activator (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- SIMILARITY: Belongs to the SNF2/RAD54 helicase family.
-!- SIMILARITY: Contains 2 chromo domains.
-!- SIMILARITY: Contains 1 PHD-type zinc finger.
-!- CAUTION: Ref.3 sequence differs from that shown due to a stop codon in position 628 and a frameshift in position 720.
-- CAUTION: Ref.4 sequence differs from that shown due to cloning
                                                                                                                                                                                                                                                                                 "Annotation of the Drosophila melanogaster euchromatic genome:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GO; GO:0005634; C:nucleus; ISS.

STRAIN=Bristol N2;

Matchews P., McMurray A.;

Submitted (NOV-1995) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Chromatin-remodelling protein that function in vulval cell fate determination.

-!- SUBCELLULAR LOCATION: Nuclear (Potential).

-!- SIMILARITY: Belongs to the SNR2/RAD54 helicase family.

-!- SIMILARITY: Contains 2 PHD-type zinc fingers.

-!- SIMILARITY: Contains 2 chromo domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE FROM N.A.

                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cain S.A., Monk P.N.;

"The orphan receptor CSL2 has high affinity binding sites for complement fragments C5a and C5a des Arg(74).";
J. Biol. Chem. 277:1165-7169(2002).

-!- FUNCTION: Receptor for the Chemotactic and inflammatory peptide anaphylatoxin C5a, C4a and C3a and their des arginated derivatives. Couples weakly to Gi-mediated signaling pathways.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUB SPECIFICITY: Frontal cortex, hippocampus, hypothalamus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
                      REMOVED IN MATURE FORM (POTENTIAL). S-farnesyl cysteine (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         [2]

Natl. Acad. Sci. U.S.A. 97:14224-14228(2000).

-!- CATALYTIC ACTIVITY: ATP + L-1ysine + tRNA(Lys) = AMP + diphosphate + L-1ysyl-tRNA(Lys).

-!- SUBCELLULAR LOATION: Cytoplasmic.

-!- MISCELLANBOUS: Able to charge E.coli tRNA(Lys) in vitro.

-!- MISCELLANBOUS: Able to charge E.coli tRNA(Lys) in vitro.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a 

residues

```
cc peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides by oxidiaing the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic cc peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

Cc characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cc crebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid corporateure. The monomeric and bicyclic peptides are used to interfere vasculariation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to modulate vascular permeability or brain. The peptides are used to modulate vascular permeability are least one biological activity induced by VEGF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human consideration of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and peptides by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenes; to cyclisation are used to interfere with angiogenes; condition are used to interfere with angiogenes; to cyclisation are used to interfere with angiogenes; condition is diabetic retinopathy, psoriasis, arthrogathy. The condition is diabetic retinopathy, psoriasis, arthrogathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive to rememe a substance-induced neovascular sequelae, nypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability cor brain. The peptides are also used to modulate vascular permeability or brain. The peptides are used to image blood vesels and lymphatic cor brain. The peptides are used to image blood vesels and lymphatic cor brain the petides are used to image blood vesels and lymphatic cor brain the last one biological activity induced by VEGF. VEGF. Cor D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human verses of vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betacenested loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior cyclising the peptide with at least one amino acid deleted prior peptides, and acyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis.

Comparation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis.

Confaraterised by angiogenesis, neovascularisation or lymphangiogenesis.

Confaraterised by angiogenesis, neovascularisation or lymphangiogenesis.

Confaraterised malignant or benign tumour, post-recovery corresponsed by angiogenesis, neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver confirmed in peripheral limbs or in lungs, peritoneal cavity, pleura, infection. The peptides are used to indefere correct or brain. The peptides are used to indefere correct or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or D and care also used in combination with an unit infilmment of contractive and chickle are used to interfere contractive and chickle are used to interfere contractive and chickle are used to interfere contractive and chickle are used to interfere contractive and chickle are used to interfere contractive and contractive and contractive and contractive and contractive and contractive and contractive and contr
                                                                                                                                                                                 Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Example 25; Page 47; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human verses and vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betact carbon separation distances on opposite antiparallel strands of a petide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

Conversional are used to interfere with angiogenesis.

Converterised by angiogenesis, neovascularisation or lymphangiogenesis.

Converterised by angiogenesis in a mammal with a condition characterised by falling a condition or benign tumour, post-recovery cerebrovascular accident, post-rangioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive correspondent induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid cormulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to inage blood vessels and lymphatic vascularing are used to image blood vessels and lymphatic correct and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and characterised by the condition with an anti-inflammation; to treat a chapter or return of a separatic retunopathy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic wasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF.C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthitis, psoriasis and

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human vegoe 0 to according to the peptide by a measuring beta-cc peptide of producing a monomeric monocyclic peptide by a measuring beta-cc peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cyclein and exposed loop of a growth factor protein and cyclisation are used to interfere with angiogenes; The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenes; to cyclisation are used to interfere with angiogenes; to cyclisation are used to interfere with angiogenes; to cyclisation is diabetic retinopathy, psoriaasis, atthropathy. The condition is diabetic retinopathy, psoriaasis, atthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or condition is diabetic retinopathy, psoriaasis, atthropathy. Corebrovascular accident, post-angioplasty restenosis, head, heat or chromon-related angiogenic dysfunction, diabetes induced neovascular sequelae, nypertension induced neovascular sequelae, or chromic liver commandal has are also used to modulate vascular permeability corbrain. The peptides are used to image blood vesels and lymphatic corbrain. The peptides are used to image blood vesels and lymphatic corbrain are least one biological activity induced by VEGF. VEGF-C or b and are also used in combination with an anti-inflammatory agent, to treat a chromic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The sequence represents Human VEGF-D (vascular endothelial growth factor)

a mino acids val101-PR0186. The sequence is used in a method of producing

a monomeric monocyclic peptide by a measuring beta-beta carbon separation

distances on opposite antiparallel strands of a peptide loop fragment

from an exposed loop of a growth factor protein and cyclising the peptide

c by oxidising the cysteine residues. The monocyclic peptides, dimeric

bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic

peptide with at least one amino acid deleted prior to cyclisation are

lymphangiogenesis in a mammal with a condition or lymphangiogenesis. The condition is

angiogenesis, neovascularisation or lymphangiogenesis. The condition is

angiogenesis, neovascularisation or lymphangiogenesis. The condition is

malignant or benigh tumour, post-recovery cerebrovascular accident, post-

neovascularisation of the liver, excessive hormone-related angiogenic

dysfunction, diabetes induced neovascular sequelae, hypertension induced

neovascular sequelae, or chronic liver infection. The peptides are also

condition characterised by fluid accumulation in peripheral limbs or in

lunds. Derithoneal cavity. When the mammal has a

condition characterised by fluid accumulation in peripheral limbs or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lungs, peritoneal cavity, pleura, or brain. The peptides are used to mage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF.C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy
                                                                                                                                                                                                                                                                                                         Human; VEGF-D; vascular endothelial growth factor; angiogenesis; neovascularisation; lymphangiogenesis; psoriaeis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation.
                                                                                                                                                                                                                                                                  Human VEGF-D amino acids Val101-PRO186.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 1; Page 89; 102pp; English.

The present sequence represents human vascular endothelial growth factor (VEGF)-D. The specification describes a human cell line which stably corpresses VEGF-D, or fragments/analogues having VEGF-D biological activity. VEGF-D antagonists, e.g. antisense nucleic acids or triplex activity. VEGF-D antagonists, e.g. antisense nucleic acids or triplex DNA, VEGF-D variants or antibodies (especially chimeric antibodies), are useful for the treatment or alleviation of malignant melanomas, tumours or psoriasis. Angiogenesis and lymphangiogenesis stimulating amounts of vEGF-D can be administered to enhance the acceptance and/or healing of skin grafts or to stimulate the healing of a surgical or traumatic wound to treat lymphagiogenesis stimulating amounts of VEGF-D are used to treat schmilating amounts of vEGF-D are used to treat anhydrotic ectodermal dysplasia. VEGF-D antibodies are useful for detecting tumours expressing VEGF-D. Fully-Corposesed VEGF-D can be used to stimulate at least one VEGF-D. Fully-Corposes of VEGF-D can be used to stimulate at least one VEGF-D. Fully-Corposes of VEGF-D can be used to stimulate at least one VEGF-D. Fully-Corposes of VEGF-D can be used to stimulate at least one VEGF-D bioactivity differentiation and lymphangiogenesis without inducing vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A human cell line stably expressing vascular endothelial growth factor D, useful for treating melanomas or tumors expressing VEGF-D.

     This sequence represents a 109 amino acid truncated human VEGF-D (Vascular endothelial growth factor D), lacking both the N- and C- terminal regions. The invention relates to a monoclonal antibody, or fragments thereof, which is specifically reactive with the truncated human VEGF-D, and methods of preparing the antibody. The antibody of the invention interferes with the binding of VEGF-D to the VEGF receptors (VEGF-Z) and additionally is not reactive with VEGF-C. The these receptors and additionally is not reactive with VEGF-C. The antibody may be used to treat disorders associated with vascular permeability, endothelial cell proliferation, anglogenesis, lawbeard and endothelial cell (ifferentiation, especially cancer, diabetic retinopathy, psecially cancer, diabetic retinopathy, psecially cancer, diabetic retinopathy, psecially and may also be used to treat fluid accumulation in the heart and/or lung via modulation of vascular permeability. It may in the heart and/or lung via modulation of vascular permeability. This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial binds to extracellular ligand-binding domain of vascular endothelial comparison to the polypeptide of the invention comprises two receptor-binding sites of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric domain of the receptor, and at least one monomer of the dimeric polypeptide is derived from VEGF. Or VEGF-C or VEGF-D, where the polypeptide of the invention is useful for preparing a medicament for preventing or treating a disease or condition involving increased signal transduction from, or an increased activation of a VEGF increased signal transduction from, or an increased activation of a VEGF increased signal transduction from, or an increased activation of a VEGF increased signal transduction from, or an increased activation of a VEGF increased signal transduction from, or an increased activation of a VEGF increased such and an increased schain vEGF increased which can be modified and used in the construction of a VEGF-D assed KDR antagonist described in the disclosure of the invention
Novel single-chain dimeric polypeptide for inhibiting angiogenesis, bite extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 6; Length 109;

```
This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial and stock to extracellular ligand-binding domain of vascular endothelial and sycopy the factor (VBGF) type 2 receptor (KDR) or VBGF type 3 receptor (Rlt-C of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric comain of the receptor, and at least one monomer of the dimeric comparable of binding to the receptor, but incapable of activating the medicament for breyenting or treating a disease or condition involving increased signal transduction from, or an increased activating the medicament for preventing or treating a disease or condition involving type 2 or type 3 receptor e.g. for inhibiting angiogenesis or receptor increased signal transduction from, or an increased activation of a VBGF cype 2 or type 3 receptor e.g. for inhibiting angiogenesis or fype 2 or type 3 receptor e.g. for inhibiting angiogenesis. This sequence represents a variant of the human VBGF-D (STAPPA and optionally comprising a variant of the human vBGF-D disclosure of the invention. In one instance a polypeptide is claimed comprising a least one mutation selected from the group consisting of comparising a lirst monomer derived from VBGF-D having at least the mutation BSTR and optionally comprising a second monomer apply period is claimed comprising a first monomer containing a substitution consisting of SIOR, SIOR and BSTR (although the residue at position 10 is an Ile), and/or in the other VBGF-D derived monomer at least one substitution consisting of T38R, T38E, F39R, F39R, T8ER and DTGE. NOTE: This sequence is not represented in the body of the specification but has been xxx
Novel single-chain dimeric polypeptide for inhibiting angiogenesis, binds to extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse; vascular endothelial growth factor-D; VEGF-D; proliferation;

                        This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAYO8278-YO8301 are human growth factor protein fragments used in the method of the invention
                                                                                                                                                                                                                                                    Length 178;
                                                                                                                                                                                                                                                                                              Indels

                                                                                                                                                                                                                                                                                                                                                                                          g
      The invention relates to a method for activating only vascular and other an active amount of a composition comprising a cell bearing the receptor an active amount of a composition comprising a cell bearing the receptor an active amount of a composition comprising a colypeptide having at least 90%, preferably 95%, sequence identity with the mouse vEGF-D polypeptide or its fragment. The polypeptide is useful for activation of specifically activates VEGF receptor-3 which results in proliferation of 1 ymph vessel endothelial cells. The polypeptide is useful for activating only vEGF receptor-3 and is therefore useful for stimulating proliferation and/or maintaining of only lymph vessel endothelial cells. The polypeptide is also useful in the diagnosis of a neoplastic disease characterized by an increase in lymph vessel endothelial cells. The mouse vEGF-D has two isoforms. The longer amino acid sequence designated mVEGF-C vEGF-D has two isoforms. The longer amino acids (AAM47932) after cresidue 30 and diverges in the C-terminal sequence after residue 317 cresidue 30 and diverges in the C-terminal sequence after residue 30 compared to the shorter isoform mVEGF-D2, which diverges after residue 312 comparing residues 92-201 of the full length mouse VEGF-D2 protien of comparing a sequence is that of the full length mouse VEGF-D2 protien of

                                                                                                         inhibitors of NVR may be used to suppress or prevent angiogenesis and thus prevent the growth and development of cancers such as cancer of the brain, breast, intestine, kidney, lung, ovary, pancreas, prostate or uterus. The products of the invention can be used for gene therapy. This sequence represents the human NVR protein described in the disclosure of
angiogenesis and cell proliferation. NVR may also be used to promote revascularisation following traumatic amputation and surgical reconstruction or added to a tissue culture to promote vasculogenesis in tissues for autologous or heterologous transplant. Antagonists or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         vascular endothelial growth factor; VBGF-D; angiogenesis; modification; acceleration; wound healing; tissue; organ; transplants; collateral dirculation; infarction; arterial stenosis; coronary artery disease; inhibition; cancer; treatment; diabetic retinopathy; lung disorders; blood circulation; gaseous exchange; chronic obstructive airway disease; intestinal malabsorptive syndrome; biopsy; metastatic risk; detection;

for detection and diagnosis

wound healing, tissue or organ transplantation. Or to establish

collateral circulation in tissue infarction or arterial stenosis, such as

coronary artery disease, and inhibition of angiogenesis in the treatment

of cancer or of diabetic retinopathy. It can also be used in the

treatment of lung disorders to improve blood circulation in the lung

and/or gaseous exchange between the lungs and the blood stream or to

improve blood circulation to the heart and 02 gas permeability in cases

of cardiac insufficiency, to improve blood flow and gaseous exchange in

chronic obstructive airway disease, or to treat malabsorptive syndromes

chronic obstructive airway disease, or to treat malabsorptive syndromes

to the intestinal tract. Quantitation of VBGF-D in cancer blopsy

specimens may be useful as an indicator of future metastatic risk.

Antagonists can be used for treating e.g. conditions such as congestive

cheart failure, involving accumulations of fluid in the lung resulting

from increases in vascular permeability. The products can also be used

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

pyldermal growth factor receptor homolog precursor - fluke (Schistosoma mansoni)
N;Contains: protein-tyrosine kinase (BC 2.7.1.112)
C;Species: Schistosoma mansoni
C;Species: Schistosoma mansoni
C;Species: Schistosoma mansoni
C;Accession: A4558; S27836
R;Shoemaker, C.B.; Ramachandran, H.; Landa, A.; dos Reis, M.G.; Stein, L.D.
